The pZ130 transcriptional initiation region is considered to be ovary-specific. It can be utilised in DNA constructs for the expression of heterologous genes, partic. in early fruit development, and esp. for expression of a melanin synthesis gene in transgenic cotton. The native function of the pZ130 gene product (AAR97559) is unknown. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA construct for expressing melanin synthesis gene in plant ovule cells - contains promoter from the tomato pZ130 gene, also binary vector and transgenic plants, esp. cotton, contg. construct

                                                                                                                                                                                                                   Calgene Lambda 140 genomic clone (AAT48816) overlaps with the tomato ovary-specific p2130 CDNA clone (see also AAT48813) and includes regions 5' and 3' to p2130. It was isolated from a tomato cv. UC82B genomic library using p2130 as probe. The genomic clone can be used to construct p2130 promoter cassettes useful for directing ovary tissue transcription in plants, e.g. modify colour phenotype in cotton.
                                                                                                                                                                                    Sequence 3528 BP; 1191 A;

                To prepare pCGN2901, Calgene Lambda 140 was digested with Sall and the resulting fragment which contains the pZ7-hybridising region was inserted into pCGN2015, at the unique Sall site. pCGN2902 contains the other Sall fragment (non-pZ7-hybridising) of the pZ130 genome derived from Sall digestion of Calgene Lambda 140 also put into a pCGN2015 construct. Plasmid DNA isolated from pCGN2901 was used in the construction of a pZ130 Promoter Cassette. The promoter is ovary-specific and wound-inducible in leaf cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ovary clone

                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence shows the complete sequence of the region of Calgene lambda 140 genomic clone that overlaps with the p2330 cDNA clone and a partial sequence of regions 5' and 3' to that region. It is possible that small gaps in the sequence may exist upstream from the Sall site bound at position 808. The clone is used in the construction of a novel expression cassette comprising in the 5'.3' direction of transcription, as operably joined components: a transcriptional and translational initiation region from Z130, a DNA sequence encoding an enzyme in a cyrcokinin metabolic pathway and a transcription termination region. The enzyme is pref. DNA transferase. The expression cassette cam be used to modify a plant phenotype by modifying cytokinin levels during a specific time and/or in specific tissues during the development of a plant. Control of cytokinin concess can be used to increase the total solids content of ripe fruit, improve retention of early fruit and alter the time of conset of ripening. See also AAQ3144-5.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAQ34941
                   The sequence given shows the sequence of the region of the Calgene Lambda 140 genomic clone which overlaps with the pZ130 cDNA clone and a partial sequence 5 and 3 to that region. The pZ130 sequence is expressed during the early stages of anthesis in tomatos. The message is expressed in ovary integumen and ovary outer pericarp tissue. It is not readily detectable in other tissues or at other stages of fruit developement. The transcription initiation region associated with this gene is therefore considered to be ovary-specific. The actual function of the pZ130 polypeptide is unknown. The transcription initiation region can be used for modulation of endogenous fruit products, for production of exogenous products and for modification of the pZnotype of fruit thand fruit products.
                                                                                                                                                                                                                                  DNA constructs contg. tomato pZ130 transcriptional region - useful for modulation of endogenous fruit

The thionine protein has an effect of improving the salt stress resistance of a plant. The gene can imp the salt stress resistance of a plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1; Page 4; 6pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The tomato pZ130 clone contains a 564 bp insert of cDNA (AAT31823) detected only in a tomato cDNA library prepd. from pre-anthesis RNA. It codes for a protein (AAR97559) of unknown function. The clone was isolated from a library prepd. from cDNA of pre-anthesis stage ovaries. The pZ130 transcriptional initiation region is considered to be ovary-specific and can be utilised in DNA constructs for the expression of heterologous genes, partic. in early fruit development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA construct for expressing melanin synthesis gene in plant ovule cells - contains promoter from the tomato pZ130 gene, also binary vector and transgenic plants, esp. cotton, contg. construct

The tomato-derived transcriptional initiation region which regulates the expression of the sequence corresp. to the p2130 clone is considered ovary-specific. Sequences hybridisable to the p2130 clone, e.g. probe p27, show abundant mRNA, esp. at the early stages of anthesis. The message is expressed in ovary integument and ovary outer pericarp tissue and is not expressed, or at least not readily detectable, in other tissues or at any other stage of fruit development. The native function of the amino acid sequence encoded by the structural gene comprising p2130 is unknown.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel polypeptides (AAW08364 and AAW08385) are respectively encoded by tomato pZ130 (AAT48813) and pZ70 (AAT48814) ovary-specific genes. Their native function is unknown. The promoter regions of the genes can be used to direct ovary-specific transcription of a
                                                                                                                                                       New ovary tissue transcriptional in tomato plant ovaries for use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        25-MAR-2003

This sequence is expressed during the early stages of anthesis in tomatos. The message is expressed in ovary integumen and ovary outer pericarp tisses. It is not readily detectable in other tisses or at other tisses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             tissue. It is not readily detectable in other tissues or at other stages of fruit development. The transcription initiation region associated with this gene is therefore considered to be ovary-specific. The actual function of the pZ130 polypeptide is unknown. The transcription initiation region can be used for modulation of endogenous fruit products, for production of exogenous products and for modification of the phenotype of fruit and fruit products. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         prodn. of exogenous prods

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes the use of transcriptional factors ovary tissue. The present sequence represents a protein sequence which is used in an example from the present invention.

The present invention relates to the thionine gene of Capsicum annum L. cv. Hanbyul, and a probing method of resistance for plant diseases, caused by Xanthomonas campestris subsp. vesicatoria, Collectotrichum coccodes, Colletotrichum gloeosporioides and the like

represents Capsicum annuum

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention provides new isolated nucleic acid molecules encoding a pepper defensin protein (PepDef) and a pepper thionin-like protein (PepThi). The PepDef and PepThi genes are useful for producing transgenic plants that exhibit enhanced resistance against phytopathogens, e.g. fungi, bacteria, viruses, nematode, mycoplasma-like organisms, parasitic higher plants, flagellate protezoa or insects. proteinase inhibitor - soybean

C;Species: Glycine max (soybean)

C;Date: 30-Apr-1999 #sequence_revision 30-Apr-1999 #text_change |
C;Accession: T06381

R;Cushman, J.C.; Maitra, N.
submitted to the EMBL Data Library, July 1994
A;Description: Isolation and expression of a drought-induced prof A;Reference number: Z15640
A;Accession: T06381
A;Accession: T06381
A;Molecule type: mRNA
